

4061. Minimum Queen Moves to Reach Target

Solved ●

Easy Topics

There is an 8×8 empty chessboard with **1-indexed** rows and columns.

You are given an array `source = [sr, sc]` representing the starting position of a **queen**, and an array `target = [tr, tc]` representing the target position.

In one move, the queen travels one or more squares along a single **row**, **column**, or **diagonal**, staying within the board.

Return the **minimum** number of moves for the queen to land **exactly** on `target`.

Example 1:

Input: `source = [8,1], target = [1,8]`

Output: 1

Explanation:

A single diagonal move takes the queen straight from $(8, 1)$ to $(1, 8)$.

Example 2:

Input: `source = [4,2], target = [1,3]`

Output: 2

Explanation:

The queen moves from $(4, 2)$ to $(4, 3)$, then from $(4, 3)$ to $(1, 3)$, reaching the target in 2 moves.

Example 3:

Input: `source = [1,1], target = [1,1]`

Output: 0

Explanation:

The queen is already at the target position, so no moves are needed.

Constraints:

- `source == [sr, sc]`
- `target == [tr, tc]`
- `1 <= sr, sc, tr, tc <= 8`
